Erythrocytes, or red blood cells (RBCs), transport oxygen ( $O_2$ ) and carbon dioxide ( $CO_2$ ) in the blood. Erythrocytes contain the protein hemoglobin to which both  $O_2$  and  $CO_2$  attach. Mature erythrocytes lack a nucleus and most cellular organelles, thereby maximizing the cell's volume and thus its ability to carry hemoglobin and transport  $O_2$ .

single gene, and for each gene, two alleles, or forms, of the gene are inherited (one allele from each parent). Each blood group gene may have two or more different alleles in the population. Although not all blood group proteins stimulate the immune response, two important ones do: ABO blood group.

## **Anatomy and Physiology - CliffsNotes Study Guides**

The heart separates the pulmonary and systemic circulations, which ensures the flow of oxygenated blood to tissues.

**Anatomy of the Heart** The cardiovascular system can be compared to a muscular pump equipped with one-way valves and a system of large and small plumbing tubes within which the blood travels.
