The consensus on the endocrine control of growth and reproduction in the Nereidae has been that of a single-hormone model. In this model, the supra-oesophageal ganglion secretes a juvenile hormone called nereidine. High concentration of nereidine promotes growth and regeneration of lost segments in young animals (Golding 1967).

The endocrine control of reproduction in Nereidae: a new ...

Controlling reproduction either by improving efficiency or preventing population increases in commercially important and non-indigenous species, respectively, is of critical importance to farmers and fish and wildlife biologists. To control reproduction, it is critical to understand the underlying mechanisms of neuroendocrine control.
