A psychologic test is a set of stimuli administered to an individual or a group under standard conditions to obtain a sample of behavior for assessment. There are basically two kinds of tests, objective and projective. The objective test requires the respondent to make a particular response to a structured set of instructions (e.g., true/false, yes/no, or the correct answer).

Managing clinical trials, of whatever size and complexity, requires efficient trial management. Trials fail because tried and tested systems handed down through apprenticeships have not been documented, evaluated or published to guide new trialists starting out in this important field. For the past three decades, trialists have invented and reinvented the trial management wheel.
